## **DETAILED ACTION**

### ***Drawings***

1. Figures 3, 6, 7 and 9 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

### ***Specification***

2. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

The following title is suggested: Engine Revolution Controlled Generator Set Having An Inverter.

### ***Claim Rejections - 35 USC § 102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-4 are rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent No. 4,973,896 to Shiga et al.

Shiga et al. clearly teaches the construction of an automobile generator apparatus (1) having:

a converter (17) composed of semiconductor rectifying devices for rectifying the power output of a magnetic generator and an inverter (4) for converting a direct current

Art Unit: 2834

output of the converter into an alternating current form of a particular frequency, comprising:

a semiconductor rectifying device driving means (70) for controlling the conduction of the semiconductor rectifying devices to maintain the voltage output of the converter at a target voltage level;

a revolution detecting means (6) for detecting the revolution of the magnetic generator;

a target voltage setting means for determining the target voltage level so that the target voltage level show a positive characteristic to the revolution detected;

a conduction rate detecting means for detecting the conduction rate of the semiconductor rectifying devices;

an engine revolution controlling means (9) for controlling the revolution of an engine to drive the generator so that the conduction rate is converged on a predetermined target rate, wherein the controlling of the revolution of the engine is implemented by adjusting the supply of fuel to the engine; and wherein:

the engine revolution controlling means is arranged to decrease the revolution of the engine when the deviation of the conduction rate from the target rate is positive and increase the same when negative (Figure 31); and

a rate of change of the revolution of the engine is greater at an increase than at a decrease thereof (Figure 53).
